These galleries consist of one or more vertical pipes leading to a horizontal, perforated pipe laid within a trench, often backfilled with gravel or some other permeable material. Such a design is commonly used to return treated ground water at aquifer remediation sites, but conceivably could be used to facilitate agricultural drainage at some sites. Each of the vertical pipes in such a system, individually or in a series, should be considered an injection well subject to UIC authorities (Elder and Lowrance, 1992). Other kinds of systems with a drainfield type of design are also likely to be considered shallow injection wells, as long as they release fluids underground as opposed to a surface water body or the land surface. These may include french drains, tiles drains, infiltration sumps, and the like. Injection wells, however, do not include surface impoundments or ditches that are wider than they are deep. Therefore, although such features are commonly used to direct or retain surface and or subsurface drainage at farms, they do not...
